

Rec'd 9/30/85

MONTHLY VITAL STATISTICS REPORT

Provisional Data From the National Center for Health Statistics

Vol. 33, No. 13 • September 26, 1985

Annual Summary of Births, Marriages, Divorces, and Deaths: United States, 1984

The provisional number of live births and the birth rate per 1,000 population for 1984 were higher than the comparable figures for 1983. The increase in the number of births brought the annual total of births to the highest level observed since 1970. The increase in the birth rate reversed the decline recorded during the previous year.

The number of marriages also increased in 1984 and reached a new national record. However, because the population increased at about the same pace, the marriage rate per 1,000 population remained at the level reported in 1983.

The number of divorces and the divorce rate per 1,000 population for 1984 were lower than the comparable figures for 1983. The divorce rate for 1984 was lower than it had been since 1975.

The provisional number of deaths increased in 1984, reflecting the continued increase in the size of the population, especially at 65 years of age and over. The age-adjusted death rate and life expectancy at birth remained at about the same levels as in 1983. However, the infant mortality rate continued to decline in 1984 to the lowest level ever recorded in the United States. Age-adjusted death rates declined in 1984 for Diseases of heart, Chronic liver disease and cirrhosis, and Atherosclerosis. Rates increased for Pneumonia and influenza and for Septicemia.

Births

An estimated 3,697,000 babies were born in the United States during 1984, a 2-percent increase over the provisional estimate for 1983 (3,614,000). The birth rate was 15.7 live births per 1,000 population, 1 percent above the rate for 1983 (15.5). The fertility rate was 66.0 live births per 1,000 women aged 15-44 years, 1 percent higher than the estimated fertility rate for 1983 (65.4). (See tables A and B and figure 1.)

The 2-percent increase in the number of births brought the annual total to the highest level observed since 1970 (3,731,386). The 1-percent increases in the birth and fertility rates in 1984 reversed the declines measured for these rates during the previous year.

The seasonally adjusted monthly birth and fertility rates in 1984 were higher in 8 months and lower in 4 months of the year than the rates in 1983 (table C). There was no consistent pattern in the seasonally adjusted rates except that the rates were higher for each of the last 4 months of 1984 than for the same months of 1983.

Changes in the annual number of births are affected mainly by two factors: trends in age-specific birth rates and changes in the number of women in the childbearing ages. The 2-percent increase in the number of births coupled with the 1-percent rise

December	15.7	14.7	66.1	62.2

in the fertility rate indicate that age-specific birth rates increased for at least some age-of-mother groups between 1983 and 1984. The total number of women in the childbearing ages increased as well, but only by 1 percent overall; changes in the number of women at various ages were not uniform. The number of teenagers 15-19 years of age declined in 1984 by 3 percent, while the number of women in their early twenties fell 1 percent. These are the ages at which nearly half of all births occur annually in the United States. Increases of 1 to 4 percent were measured for age groups 25-29 through 40-44 years, with the largest increases observed for women aged 35-39 and 40-44 years (4 percent). Rates of childbearing for women in the age groups 35-44 years, however, tend to be very low.

According to projections prepared by the U.S. Bureau of the Census, the number of women in the childbearing ages will increase again by about 1 percent between 1984 and 1985 and then stabilize through the late 1980's.¹ The number of women aged 15-24 years will continue to decline, however, as those born during the low birth years of the early to mid 1970's reach the childbearing ages. During the next several years, therefore, increases in the number of births will require increases in the birth rates for at least some age groups.

Provisional data by place of occurrence indicate that there were increases in the number of births between 1983 and 1984 of 1-2 percent in two geographic divisions (Middle Atlantic and South Atlantic) and 5-9 percent in two divisions (West South Central and Pacific). There were declines of up to 2 percent in the remaining five divisions. Birth rates per 1,000 population increased by 1-7 percent in three divisions (Middle Atlantic, West South Central, and Pacific), remained level in two divisions (East North Central and South Atlantic), and declined 1-3 percent in the remaining four divisions.

Increases and declines in the number of births by State were nearly evenly split, with increases in 26 States and the District of Columbia and declines in 24 States. The birth rate increased in 20 States and the District of Columbia and de-

clined in 25 States. There was no change in the rate for five States.

Natural increase

During 1984 an estimated 1,650,000 persons were added to the population as a result of natural increase, the excess of births over deaths. The rate of natural increase was 7.0 persons per 1,000 population, 1 percent above the 1983 rate of 6.9. This increase was due to the rise in the birth rate.

Marriages

The marriage rate was 10.5 per 1,000 population in 1984 for the second consecutive year (table A). This rate, recorded since 1867, has varied between a high of 16.4 in 1946 and a low of 7.9 in the depression year of 1932. Final data for 1980 through 1982 show that the marriage rate was stable at 10.6 per 1,000 population. Provisional data showed a slight decline to 10.5 in 1983 and a leveling off in 1984 (figure 2).

Although the marriage rate per 1,000 population remained the same in 1984 as in 1983, the number of marriages increased to 2,487,000, the greatest annual total in U.S. history.

Marriages followed a seasonal pattern in 1984 that has become typical in the United States, lowest in January and highest in June (tables D and E). The June marriage rate, 15.8 per 1,000 population, was more than twice as high as the January rate, 6.4.

Marriage rates vary widely among States. The States with the lowest rates in 1984 were Pennsylvania (7.8), West Virginia (7.9), and Connecticut (8.0). States with the highest rates were Nevada (117.9), South Carolina (16.9), Hawaii (14.3), Arkansas (13.4), Alaska (13.0), Georgia (13.0), and Texas (13.0). While Alaska, Georgia, and Texas all reported the same provisional rate in 1984, this rate represents a substantial rise over the 1983 rates for Georgia (12.5) and Texas (12.4) but a sharp drop from the 1983 level for Alaska (14.3).

Divorces

The divorce rate for 1984 was 4.9 per 1,000 population, 8 percent below the record high set in 1979 and 1981 (5.3) and lower than it had been since 1975 (table A).

The number of divorces dropped in 1984 (table F). An estimated 1,155,000 couples divorced, 2 percent fewer than the number in 1983 and 58,000 (5 percent) fewer than the final total reported for 1981 when the national divorce total reached a historic high of 1,213,000.

Divorce rates vary geographically, being generally lowest in the Middle Atlantic and New England Divisions and highest in the West South Central and Mountain Divisions. For example, the rate in Massachusetts (2.9) is half as high as the rate in Colorado (5.8) and the rates in New York and Pennsylvania (3.4) are less than half as high as rates in Nevada (13.7), Oklahoma (7.3), and Wyoming (7.2).

Among States from which provisional data were available in 1984, the highest divorce rates were reported by Nevada (13.7); Alaska (7.8); Oklahoma (7.3); Wyoming (7.2); Florida

(6.9); Arkansas (6.6); and Arizona, New Mexico, and Tennessee (all with a rate of 6.5).

Marriage and divorce rates tend to vary together, with both rates relatively high or both rates relatively low for any particular State. In general, the divorce rate is less than half as high as the marriage rate. In 1984, however, 17 States had exceptionally high ratios of divorces to marriages: Alabama, Alaska, Arizona, Colorado, Delaware, Florida, Kansas, Montana, New Mexico, North Carolina, Ohio, Oklahoma, Oregon, Tennessee, Washington, West Virginia, and Wyoming.

Deaths

During 1984 an estimated 2,047,000 deaths occurred in the United States, the greatest number ever recorded. The pro-

Table E. Marriage rates, seasonally adjusted and unadjusted, by month: United States, 1983 and 1984

[Rates on an annual basis per 1,000 women aged 15-44 years. For method of seasonal adjustment, see Technical notes]

Month	Unadjusted for seasonal variation		Adjusted for seasonal variation

November.....	42.0	41.3	45.6	45.9
December.....	41.2	38.7	44.1	42.6

visional death rate for 1984 was 866.8 deaths per 100,000 population, approximately 1 percent higher than the provisional rate for 1983 (858.9). The record number of deaths in 1984 reflects a general increase in the size of the population, especially at 65 years of age and over. However, as a result of the continued decline in the death rates for most age groups, the provisional age-adjusted death rate for 1984 was the lowest ever recorded in the United States (547.7 deaths per 100,000 population) (figure 3). This rate was about the same as the provisional age-adjusted death rate for 1983 (549.6). Age-adjusted death rates control for changes and variations in the age composition of the population. Therefore, they are usually

better indicators than crude death rates for showing changes in mortality risk over time and between race-sex groups within the population.

Unadjusted death rates were somewhat higher for January, March, May, June, August, September, November, and December 1984 than for the same months in 1983. Rates for April and October were the same in 1984 as in 1983. For the remaining months of 1984, death rates were lower than for the previous year (table G).

Expectation of life

The expectation of life at birth in 1984 was the same as the record high set in 1983—an estimated 74.7 years for the total population. Record highs were established in 1984 for white females, 78.8 years; white males, 71.8 years; and black males, 65.5 years. Life expectancy for black females declined slightly, to 73.7 years.

Figure 3. Crude and age-adjusted death rates: United States, 1930–84

December.....	183,000	175,000	9.1	8.8

Provisional data showed a continued narrowing of the difference in life expectancy at birth between males and females by race. Among the white population, from 1983 to 1984 life expectancy increased by 0.2 year for males compared with 0.1 year for females. Among the black population, life expectancy at birth increased by 0.1 year for males, but decreased 0.3 year for black females. The expectation of life at birth represents the average number of years that a group of infants would be expected to live if, throughout life, they were to experience the age-specific death rates prevailing during the year of their birth.

Death rates by race and sex, and by age

Race and sex differentials—Age-adjusted death rates reached new lows in 1984 for each race-sex group except black females. White females had the lowest estimated age-adjusted death rate (391.4 deaths per 100,000 population), followed by black females (586.2), white males (694.6), and black males (1,016.1). Between 1983 and 1984, age-adjusted death rates decreased 1 percent for white males, remained essentially the same for black males and white females, and increased 3 percent for black females (from 571.5).

Age differentials—Between 1983 and 1984, provisional death rates decreased for persons aged 85 years of age and over and increased for those 75–84 years. Death rates for other age groups did not change significantly between the two successive years (table H).

Major causes of death

The 15 leading causes of death in 1984 accounted for 88 percent of all deaths in the United States (table J). The leading causes of death for 1979 through 1984 have been the same, but the order has varied. Nephritis, nephrotic syndrome, and nephrosis (the 13th leading cause of death in 1983) moved ahead of Homicide and legal intervention and Certain conditions orig-

Table H. Death rates by age for 1983 and 1984 and percent difference between 1983 and 1984: United States

¹Figures for age not stated are included in "All ages" but not distributed among age groups.

inating in the perinatal period to become the 11th leading cause in 1984.

For most causes age-adjusted death rates are better indicators than crude death rates for showing changes in mortality risk over time. Such rates are used to depict trends for 13 of the 15 leading causes of death. For the other two leading causes of death, which occur mainly among infants under 1 year of age (Certain conditions originating in the perinatal period and Congenital anomalies), age-adjusted death rates are not shown. Changes in mortality for these two causes are measured by the infant mortality rate per 100,000 live births. The infant mortality rate for Certain conditions originating in the perinatal period for 1984, 505.3 infant deaths per 100,000 live births, was not significantly different from the 1983 rate (519.7). Similarly, the rate for Congenital anomalies, 228.1, was also not significantly different from the 1983 rate, 231.6.

Age-adjusted death rates were lower in 1984 than in 1983 for three leading causes: Diseases of heart, Chronic liver disease and cirrhosis, and Atherosclerosis. Age-adjusted death rates for Diseases of heart and Atherosclerosis have generally declined since 1950 and for Chronic liver disease and cirrhosis since the mid-1970's (figure 4).

Age-adjusted rates for two leading causes of death increased between 1983 and 1984. The age-adjusted rate for Pneumonia and influenza increased 9 percent, from 11.2 deaths per 100,000 population in 1983 to 12.2 in 1984; it also increased 12 percent for Septicemia, from 3.4 in 1983 to 3.8 in 1984. Even though the rates for the broad category Accidents and adverse effects did not change significantly between the two years, the rate for Motor vehicle accidents—a component of the broader category—increased 6 percent between 1983 and 1984, a reversal of the decline observed between 1980 and 1983.

For the remaining seven leading causes of death, provisional data did not indicate a significant change between 1983 and 1984.

Table J. Death rates and percent of total deaths for 15 leading causes of death: United States, 1984

Based on a 10-percent sample of deaths; see Technical notes. Rates per 100,000 population. See table 8 for category numbers of causes of death]

Rank	Cause of death (Ninth Revision, International Classification of Diseases, 1975)	Death rate	Percent of total deaths

Infant mortality

In 1984 an estimated 39,200 infants died in the United States. The estimated infant mortality rate of 10.6 deaths per 1,000 live births was the lowest annual rate ever recorded in the United States (table K). The decline (3 percent) between

1983 and 1984 was a reflection of the continuing decrease in the neonatal mortality rate (deaths of infants under 28 days per 1,000 live births) (figure 5), while the post-neonatal mortality rate (28 days to 11 months) remained essentially unchanged. None of the causes of infant mortality changed significantly between 1983 and 1984 (table L).

Figure 4. Age-adjusted death rates for 13 of the 15 leading causes of death: United States, 1950-84

Table K. Deaths under 1 year and infant mortality rates, by month: United States, 1983 and 1984

[Rates on an annual basis per 1,000 live births. Monthly rates adjusted for changing numbers of births; see Technical notes]

Month	Number		Rate		Month	Number		Rate	
	1984	1983	1984	1983		1984	1983	1984	1983
Total	39,200	39,400	10.6	10.9	June	3,100	2,900	10.5	9.8
January	3,500	3,600	11.3	11.6	July	3,200	3,300	9.7	10.2
February	3,300	3,400	11.4	12.1	August	3,300	3,200	10.2	10.1
March	3,400	3,500	11.6	11.0	September	3,200	3,200	10.0	10.5
April	3,200	3,300	10.6	11.4	October	3,300	3,500	10.6	11.5
May	3,200	3,300	10.6	10.9	November	3,200	3,000	10.9	10.3
					December	3,300	3,200	10.5	10.7

Figure 5. Infant and neonatal mortality rates: United States, 1930-84

Table L. Infant mortality rates by age and for 10 selected causes of death: United States, 1979-84

[For 1983 and 1984, based on a 10-percent sample of deaths; for all other years, based on final data. Rates per 100,000 live births. For further discussion, see Technical notes]

<i>Age and cause of death</i> (Ninth Revision, International Classification of Diseases, 1975)	1984 (est.)	1983 (est.)	1982	1981	1980	1979
Total, under 1 year.....	1,059.6	1,090.6	1,152.0	1,193.2	1,260.3	1,306.8
Under 28 days.....	686.1	726.7	769.9	802.4	847.6	886.6
28 days to 11 months.....	373.9	364.5	382.2	390.8	412.7	420.2
Certain gastrointestinal diseases..... 008-009,535,555-558	7.6	7.2	7.6	7.7	8.2	9.7
Pneumonia and influenza..... 480-487	17.0	21.3	20.5	22.3	28.0	32.3
Congenital anomalies..... 740-759	228.1	231.6	245.2	245.6	255.2	255.4
Disorders relating to short gestation and unspecified low birth weight..... 765	93.3	92.7	98.3	100.8	101.0	100.0
Birth trauma..... 767	8.9	11.9	16.8	25.3	29.3	32.3
Intrauterine hypoxia and birth asphyxia..... 768	26.2	31.8	40.5	38.7	41.4	39.9
Respiratory distress syndrome..... 769	103.9	101.3	109.7	119.0	138.1	156.2
Other conditions originating in the perinatal period..... 760-764,766,770-779	272.7	282.0	296.8	308.9	319.8	339.0
Sudden infant death syndrome..... 798.0	131.7	130.1	143.4	145.9	152.5	151.1
All other causes..... Residual	170.2	181.0	173.3	179.0	186.7	191.0

Table 5. Death rates by age, race, and sex and age-adjusted death rates by race and sex: United States, 1950, 1960, 1970, and 1980-84—Con.

[For 1983 and 1984, based on a 10-percent sample of deaths; for all other years, based on final data. Data for 1970 and 1980-82 exclude deaths of nonresidents of the United States. Rates per 100,000 population in specified group. For method of computation of age-adjusted rates and for further discussion, see Technical notes]

Table 9. Deaths and death rates for 72 selected causes: United States, 1983 and 1984—Con.

Based on a 10-percent sample of deaths. Rates per 100,000 population. For further discussion, see Technical notes]

Cause of death (Ninth Revision, International Classification of Diseases, 1975)	Number		Rate	
	1984	1983	1984	1983
Cholelithiasis and other diseases of gallbladder 574-575	3,260	3,170	1.4	1.4
Nephritis, nephrotic syndrome, and nephrosis 580-589	20,050	18,440	8.5	7.9
Acute glomerulonephritis and nephrotic syndrome 580-581	320	360	0.1	0.2
Chronic glomerulonephritis, nephritis and nephropathy, not specified as acute or chronic, and renal sclerosis, unspecified 582-583,587	1,750	1,840	0.7	0.8
Renal failure, disorders resulting from impaired renal function, and small kidney of unknown cause 584-586,588-589	17,980	16,240	7.6	6.9
Infections of kidney 590	1,820	1,890	0.8	0.8
Hyperplasia of prostate 600	530	540	0.2	0.2
Complications of pregnancy, childbirth, and the puerperium 630-676	220	290	0.1	0.1
Pregnancy with abortive outcome 630-638	30	60	0.0	0.0
Other complications of pregnancy, childbirth, and the puerperium 640-676	190	230	0.1	0.1
Congenital anomalies 740-759	13,120	12,780	5.6	5.5
Certain conditions originating in the perinatal period 760-779	18,930	18,970	8.0	8.1
Birth trauma, intrauterine hypoxia, birth asphyxia, and respiratory distress syndrome 767-769	5,230	5,300	2.2	2.3
Other conditions originating in the perinatal period 760-766,770-779	13,700	13,670	5.8	5.8
Symptoms, signs, and ill-defined conditions 780-799	31,920	29,780	13.5	12.7
All other diseases Residual	138,240	130,440	58.5	55.7
Accidents and adverse effects E800-E949	94,610	91,290	40.1	39.0
Motor vehicle accidents E810-E825	46,380	43,700	19.6	18.7
All other accidents and adverse effects E800-E807, E826-E949	48,230	47,580	20.4	20.3
Suicide E950-E959	29,060	29,080	12.3	12.4
Homicide and legal intervention E960-E978	19,530	19,300	8.3	8.2
All other external causes E980-E999	3,170	3,340	1.3	1.4

Technical notes

Nature and sources of data

All data for 1983 and 1984 in this report are provisional. Data for the United States as a whole refer to events occurring within the United States; other data refer to events within the reporting areas shown.

Beginning with 1970, final birth and mortality statistics exclude data for births and deaths to nonresidents of the United States. Data for nonresidents are included in provisional data for 1983 and 1984.

Provisional or estimated figures for births, marriages, divorces, and deaths, except data estimated from the Current Mortality Sample, summarize data from monthly reports of the numbers of birth, marriage, divorce, and death certificates received in registration offices between two dates a month apart regardless of the month or year when the events occurred. Delay in the receipt of certificates in a registration office may result in a low count for a given month, followed by a high count for the month(s) in which the delayed records are received. While this occasionally may result in large fluctuations in State counts for a given event, the effect on provisional monthly totals for the United States is usually small. Final figures are counts of events occurring in the specified year. All mortality figures exclude fetal deaths.

Natality

Monthly estimates of births for the entire United States are based on the monthly reports adjusted for observed differences from final monthly figures. State figures are not adjusted in this manner.

Marriages

Monthly estimates of marriages for the entire United States are based on the monthly reports adjusted for observed differences from final monthly figures. State figures are not adjusted in this manner. For most States, data represent marriages performed. For New Mexico, New York City, and some counties of Arizona, data are marriage licenses issued.

Beginning with 1978, nonlicensed (confidential) marriages registered in California are included in marriage totals and rates. Further discussion of nonlicensed marriages is given in the final marriage statistics report for 1978.²

Divorces

Provisional divorce data, including reported annulments, are shown for the areas reporting divorce data monthly. Divorce figures for the United States for 1983 and 1984 are estimated from a summary of monthly reports from 48 States and the District of Columbia. These areas contained over 95 percent of the population of the United States as enumerated in 1980.

Mortality

Current mortality sample

Deaths and death rates for 1983 and 1984 by cause, age, race, and sex were estimated from the Current Mortality Sample. The Current Mortality Sample is a 10-percent systematic sample of death certificates received each month in the vital statistics offices in the 50 States, the District of Columbia, and the independent registration area of New York City. The sample for each of these areas consists of one-tenth of the death certificates received in the office between a given date and the same date of the following month. All death certificates received during the 1-month period are sampled regardless of the month or year in which the death occurred. As a result, the monthly sample is not strictly comparable to a sample on a month-of-occurrence basis. The proportions of death certificates received in the samples for each month of 1984 representing deaths occurring in the current month and those occurring in other months are shown in table I.

Because of the way in which death certificates are processed in California, this State contributes a high proportion of the certificates for deaths not occurring in the sample month. For the sample exclusive of California, the percent of the sample deaths occurring in the current month constitutes about 78 percent of the total as opposed to 71 percent of the entire sample. As for the year of occurrence, 96.81 percent of the 203,693 transcripts in the 1984 sample were for deaths occurring in 1984 and 3.2 percent for deaths occurring in 1983.

*Correction for bias and adjustment to provisional counts—*The Current Mortality Sample is selected at a specified time each month. Complete information concerning the underlying cause of death is sometimes not available in the State offices when the sample is drawn but is available later when copies of the final death certificates are processed. As a result, estimates

Table I. Percent of death certificates received in the sample each month by month of occurrence: United States, 1984

Month	Deaths occurring in—		
	Same month	Previous month	All other months
January	74.1	18.9	7.0
February	71.3	20.4	8.3
March	69.1	19.6	11.3
April	73.0	20.2	6.8
May	71.6	19.5	9.0
June	68.9	22.6	8.5
July	71.6	21.4	7.0
August	70.6	20.2	9.2
September	69.0	22.6	8.4
October	74.4	19.9	5.7
November	72.7	19.4	7.9
December	71.1	21.4	7.5

NOTE: A list of references follows the text.

based on sample counts for certain causes are recurrently biased estimates of final counts.

The sample data in this report are corrected using rules and methodology described in the Annual summary for 1978.³ The data for 1984 are adjusted for bias based on the experience of 3 years—1980, 1981, and 1982. If for a given cause the sample count for these years departs from one-tenth of the final count by more than would be expected on the basis of sampling variability alone, the sample deaths for this cause are corrected by using an adjusted weight. For all causes without an adjusted weight, a weight of 10 is used. The adjusted weights that were applied to the 1984 sample for all ages and for ages under 1 year are shown in table II.

The 1983 cause-of-death data in this report were adjusted for bias using data for 1979, 1980, and 1981. Therefore, the adjusted weights for 1984 data are not the same as those used for 1983.⁴

Sampling variability—Because the estimates of deaths and death rates presented in this report (with the exception of total deaths and deaths under 1 year) are based on a sample of the death certificates, they are subject to sampling variability. The estimated percent error shown in this report is a measure of the sampling error of the estimated number of deaths (or of the estimated death rate) expressed as a percent of the estimate. The chances are about two out of three that the percent difference between an estimate and the result of a complete count is less than the percent error shown. The chances are about 19 out of 20 that the percent difference is less than twice the percent error.

Two methods are used for estimating percent errors—one for the ratio estimates for the causes of death corrected for bias and the other for estimates for the remaining causes of death or

for given age-race-sex groups. The percent error of a ratio estimate for a given cause of death corrected for bias for all ages is computed as follows:

$$V = 300 \sqrt{\frac{1}{10} \left(\frac{1}{x} - \frac{1}{D} \right) + \left(\frac{1}{Y} - \frac{1}{M} \right)}$$

where V = percent error of the estimate X

X = the estimated number of deaths (or estimated death rate) in a given cause or age-race-sex group

x = the number of deaths in the sample from the given cause

D = 203,693, the total number of death certificates in the sample for 1984

Y = the final number of deaths from the given cause in the 3 years—1980, 1981, and 1982 combined

M = 5,952,403, the final count of all deaths occurring in the 3 years—1980, 1981, and 1982 combined

The percent errors for the remaining estimates for given causes of death not requiring a correction for bias or for a given age-race-sex group are computed as follows:

$$V = 300 \sqrt{\frac{1}{X} - \frac{1}{N}}$$

where V = the percent error of the estimate X

X = the estimated number of deaths from a given cause or for an age-race-sex group

N = 2,047,000, the provisional number of registered deaths in 1984

NOTE: A list of references follows the text.

Table II. Causes of death corrected for bias and adjusted weights for all ages and for under 1 year: United States, 1984

Cause of death ¹ (Ninth Revision, International Classification of Diseases, 1975) and age		Adjusted weight
All ages		
Other tuberculosis	013-018	13.23
All other infectious and parasitic diseases	001-003,005,020-032,037,039-041,046-054,056-066,071-088,098-139	10.72
Malignant neoplasms of all other and unspecified sites	170-173,190-199	9.62
Benign neoplasms, carcinoma in situ, and neoplasms of uncertain behavior and of unspecified nature	210-239	9.13
Diabetes mellitus	250	10.22
Hypertensive heart and renal disease	404	10.93
Angina pectoris	413	14.82
Other diseases of endocardium	424	10.44
Other diseases of arteries, arterioles, and capillaries	441-448	10.33
Renal failure, disorders resulting from impaired renal function, and small kidney of unknown cause	584-586,588-589	9.71
Symptoms, signs, and ill-defined conditions	780-799	7.73
All other diseases	Residual	10.16
Motor vehicle accidents	E810-E825	10.22
Suicide	E950-E959	10.40
All other external causes	E980-E999	11.69
Under 1 year:		
Symptoms, signs, and ill-defined conditions	780-799	9.53

¹ Causes of death eligible to have an adjusted weight were those that had 50 or more deaths based on final data for 1982.

The percent error due to sampling may be obtained by using the above formula where X is the estimated number of deaths for a given group. For easy reference, the percent errors ascribable to sampling for estimates based on several levels in the number of deaths are shown in table III.

Cause-of-death classification

The mortality statistics presented here are compiled in accordance with World Health Organization regulations, which specify that member nations classify causes of death in accordance with the current revision of the *International Statistical Classification of Diseases, Injuries, and Causes of Death*.

Causes of death for 1979–84 were classified according to the Ninth Revision.⁵ For earlier years causes of death were classified according to the revision then in use. Changes in classification of causes of death due to these revisions may result in discontinuities in cause-of-death trends. Consequently, cause-of-death comparisons between revisions require consideration of the comparability ratios and, where available, estimates of their standard errors. For information about comparability ratios between the Eighth and Ninth Revisions, see *Monthly Vital Statistics Report*, Volume 28, No. 11 Supplement.⁶

For information about comparability ratios between the Seventh and Eighth Revisions, see *Vital and Health Statistics*, Series 2, No. 66.⁷ For a list of other reports on the effects of revisions of the international lists on mortality statistics tabulated by cause, see *Vital Statistics—Special Reports*, Volume 51, No. 4.⁸

Besides specifying the classification, the World Health Organization regulations outline the form of medical certification and the coding procedures to be used. In general, when more than one cause of death is reported, the cause designated by the certifying physician as the underlying cause of death is the cause tabulated.

Causes of death for data presented in this publication were coded by procedures outlined in issues of Part 2a of *NCHS Instruction Manual*.⁹

NOTE: A list of references follows the text.

Table III. Percent errors for estimated numbers of deaths from the Current Mortality Sample

Estimated number of deaths	Percent error	Estimated number of deaths	Percent error
10	94.9	900	10.0
20	67.1	1,000	9.5
50	42.4	2,000	6.7
100	30.0	5,000	4.2
200	21.2	10,000	3.0
300	17.3	20,000	2.1
400	15.0	50,000	1.3
500	13.4	100,000	0.9
600	12.2	200,000	0.6
700	11.3	500,000	0.4
800	10.6	1,000,000	0.2

Cause-of-death ranking

Cause-of-death ranking is based on the List of 72 Selected Causes of Death, adapted from one of the special lists for mortality tabulations recommended by the World Health Organization for use with the Ninth Revision of the *International Classification of Diseases*. Two group titles—Major cardiovascular diseases and Symptoms, signs, and ill-defined conditions—are not ranked. In addition, category titles that begin with the words “other” and “all other” are not ranked. The remaining category titles are ranked according to the number of deaths for 1984 to determine the leading causes of death. When one of the titles that represents a subtotal is ranked (for example, Tuberculosis), its component parts (in this case, Tuberculosis of respiratory system and Other tuberculosis) are not ranked.

Age-adjusted rates

The age-adjusted rates presented in this report were computed by the direct method, that is, by applying the age-specific death rates for a given cause of death to the standard population distributed by age. The total population as enumerated in 1940 was selected as the standard. The age-adjusted rates were based on 10-year age groups. Rates by specified cause for 1983 and 1984 were based on the same 10-year age groups except that the age group 1–14 years was used instead of 1–4 years and 5–14 years. It is important not to compare age-adjusted death rates with crude rates.

Life tables

U.S. abridged life tables are constructed by reference to a standard life table.¹⁰ Life table values for 1980–83 appearing in this publication have been revised using life tables for the decennial period 1979–81 as the standard life tables; therefore, these figures may differ from those previously published.

Seasonal adjustment

The method of seasonal adjustment used for birth, fertility, and marriage rates is described in *The X-11 Variant of the Census Method II Seasonal Adjustment Program*.¹¹ Marriage rates were also adjusted for monthly variation in the specified days of the week (Sundays, Mondays, and so forth) because marriages are more likely on some days than on others.

Population bases for computing rates

The populations used for computing rates shown in this report (furnished by the U.S. Bureau of the Census) represent the population residing in the specified area. Populations for 1940, 1950, 1960, 1970, and 1980 were enumerated as of April 1; all other populations were estimated as of July 1.

The populations for 1984 were published by the U.S. Bureau of the Census in the *Current Population Reports*, Series P-25.^{12,13}

Infant and maternal mortality rates are based on live births. For an explanation of the method used in computing infant mortality rates adjusted for changing numbers of births, see *Vital Statistics—Special Reports*, Volume 19, No. 21.¹⁴
