

nchs MONTHLY VITAL STATISTICS REPORT

Final Data From the National Center for Health Statistics

Vol. 34, No. 9, Supplement • December 26, 1985

Advance Report of Final Divorce Statistics, 1983

Divorces and divorce rates

Divorces declined for the second consecutive year in 1983 when 1,158,000 couples divorced, 12,000 fewer than in 1982 (table 1). Between 1962 and 1981 the number of divorces almost tripled. Divorces reached a historic high of 1,213,000 in 1981 and then dropped 4 percent in 1982 and 1 percent in 1983; the drop in 1982 was the first decline in 20 years. According to provisional reports the decline continued in 1984.

For 1983, the divorce rate per 1,000 population was 4.9, down from 5.0 in 1982 and the historic high level of 5.3 in 1979 and 1981. The rate per 1,000 population has not been lower since 1975. The rate of divorce calculated per 1,000 married women 15 years of age and over was 21.3, representing the second consecutive annual drop from the rate of 22.6 in 1981. This type of rate, based on the population (married women) truly at risk of divorce, has been greater than 20 since 1975. This means that about 2 percent of the married women divorce annually.

Geographic variation in the numbers and rates of divorce are shown in table 2. Typically, the divorce rate is considerably lower in the Northeast Region than in the Midwest and both rates are considerably lower than rates in the South and West. In 1983 the divorce rate was 3.6 in the Northeast, 4.6 in the Midwest, 5.6 in the South, and 5.8 in the West. Among the 46 States and the District of Columbia for which data were complete in 1983, divorce rates ranged from a low of 3.2 per 1,000 population in Massachusetts to highs of 8.1 in Alaska, 8.5 in New Mexico, and 15.0 in Nevada.

Among the 45 States and the District of Columbia for which data were complete in both 1982 and 1983, Massachusetts replaced North Dakota as the State with the lowest rate in 1983 but in both 1982 and 1983 North Dakota, Pennsylvania, and Massachusetts had the three lowest rates. The six States with highest rates in 1982 and 1983, in descending order, were Nevada, Alaska, Wyoming, Oklahoma, Arizona, and Florida. Divorce rates dropped in 29 States and the District of Columbia, were unchanged in 6 States, and rose in 10 States.

The greatest increase in the rate was reported for Hawaii, where the rate rose from 4.2 in 1982 to 4.5 in 1983. In spite of the increase, the rate for Hawaii was below the national average in 1983 in contrast to its level in 1973 (4.9), when it was well above the national rate (4.3). Only six of the States with complete data had lower rates in 1983 than in 1973 (California, Florida, Hawaii, Michigan, Nevada, and Oklahoma). The rates for all other reporting States were 2 to 48 percent higher in 1983 than they had been a decade earlier.

Numbers of divorces are obtained annually from all States and the District of Columbia; these data are shown in tables 1 and 2. Detailed information about characteristics of husbands and wives, as well as about the characteristics of the divorce, is reported by the 31 States in the divorce-registration area (DRA), which accounted for 50 percent of all divorces in the United States in 1983. It is from these States that number of children, ages of spouses, and duration of marriage can be ascertained.

Children involved in divorce

The 1,158,000 couples that divorced in 1983 were parents of an estimated 1,091,000 children under 18 years of age who were involved in those divorces. This was 2 percent fewer than the number of children involved in divorce in 1982. The average number of children per decree was the same in both years, 0.94 per decree, and lower than it has been since 1956 (table 3). For every 1,000 children under 18 years of age, 17.4 were involved in divorce during 1983. This rate represents a drop from 17.6 in 1982 and from a historic high of 18.7 in 1981.

In 1983 as in 1982, 46 percent of couples divorcing had no children under 18 years of age, 26 percent had one child, 20 percent had two children, and 9 percent had three or more children (table 4).

The average number of children per decree and the rate per 1,000 children under 18 are shown in table 5 for the DRA and each registration State. The average number of children

Figure 1. Divorce rates: United States, 1925-83

per decree ranged among States, from a low of 0.79 in Tennessee and Virginia to a high of 1.23 in Utah. While Utah has the highest average number of children per divorcing couple, it does not have the highest rate per 1,000 children under 18 years of age. That rate ranged among States, from 12.1 in Maryland to 24.4 in Wyoming. Thus children in Wyoming were more than twice as likely to have been involved in divorce in 1983 than were children in Maryland.

Age

Age-specific divorce rates, which indicate the relative likelihood of divorce among different age groups, have been cal-

culated using data from the 28 registration States in which age at divorce was reported with sufficient completeness to provide satisfactory rates (table 6).

The rates are based on unpublished population estimates prepared by the U.S. Bureau of the Census by age and marital status of men and women. As in the past, fewer men than women are reported as married. This causes the rate of divorce for married men to be higher than that of married women because the base population is smaller. In 1983, for example, the divorce rate per 1,000 married men of all ages was 19.3, slightly higher than the divorce rate of 18.9 for married women of all ages.

It also should be noted that the divorce rate for married

Figure 2. Divorces and children involved: United States, 1960-83

women 15 years of age and over in the 28 reporting States (18.9) is lower than the rate for married women 15 years of age and over in the United States (21.3), shown in table 1. This difference reflects the fact that many of the nonreporting States are in the South and West Regions where divorce rates tend to be higher than in the Northeast and Midwest Regions.

Divorce rates generally are highest for young men and women and decline for older age groups. In 1983, divorce rates were highest for married men 20-24 years of age (45.2 per 1,000) and for teenage women (48.1). These rates mean that almost 5 percent of the married men and women of those ages divorced in 1983. The rates dropped from these high levels for each subsequent 5-year age group so that married men 40-44 years of age were only half as likely to divorce (21.5 per 1,000), and those 50-54 were one-fourth as likely to divorce (10.7 per

1,000) as were those in their early twenties. Divorce rates for married women dropped more sharply with age than for married men, so that divorce rates for married women 50-54 years of age were only one-seventh as high (7.3) as rates for married teenage women (48.1).

Between 1982 and 1983, the age-specific divorce rates increased for women aged 35 years and over and for teenage wives. For married women in age groups 20 to 34, divorce rates dropped. For men, age-specific rates rose for all groups 45 years of age and over, but for age groups under 45, divorce rates did not move uniformly up or down. For ages 15-19 years, the rates are based on small numbers of married persons, especially men, since not many teenagers are married. These small population figures, derived from a national sample survey conducted by the U.S. Bureau of the Census, have relatively

large sampling errors. Therefore the observed increases in the teenage rates should be interpreted with caution.

The age distribution of divorcing husbands and wives has been shifting gradually in recent years, with both husbands and wives, on the average, becoming older (table 7). The average (mean) age of divorcing husbands was 34.8 in 1978 and rose every year thereafter, reaching 36.1 in 1983. The average age of divorcing wives showed a trend similar to that of the men, increasing from 32.1 years in 1978 to 33.5 in 1983. However, the age difference between divorcing husbands and wives is quite stable. In 1978 the husbands were an average of 2.7 years older than their wives; in 1983 the difference was 2.6 years.

The trend in age at which divorcing spouses had been married showed a similar, but smaller, increase in recent years (table 8). The average (mean) age at marriage of divorcing husbands rose from 25.7 in 1978 to 26.6 in 1983 while the age at which divorcing wives had married rose from 23.1 to 24.0. This represents an increase of 0.9 year between 1978 and 1983 in age at marriage of divorcing spouses. Since ages at divorce increased slightly more (1.3–1.4 years) than ages at marriage, this suggests that duration of marriage increased slightly during the period.

There is variation among States in average ages at marriage and divorce. The average age of marriage for divorcing husbands ranged among States from 25.4 years in South Carolina to 28.6 years in Idaho. The average age of husbands at divorce ranged among States from 34.1 in Wyoming to 37.7 in New York (table 9).

Duration of dissolving marriages

The average duration of dissolving marriages was 9.6 years in 1983, slightly longer than the duration in 1982, when it was 9.4 years. Between 1978 and 1983 the average duration (calculated from dates of marriage and of divorce) increased by 0.5 year, a change that is in agreement with the changes in average ages at marriage and divorce discussed in the previous section. Both the median and mean duration had decreased during the early 1970's before increasing to the levels observed in 1983 (table 10).

Variations in duration from year to year are minor compared with variations among States. In 1983 duration from marriage to decree ranged from an average (mean) of 7.2 years in Wyoming to 11.8 years in Massachusetts (table 11).

¹ Medians and means computed on data by single years of duration.

Technical notes

Place and time of occurrence

Divorces, including absolute divorces, annulments, and dissolutions of marriage, are shown in all tables by State where decree was granted, which is also the State of legal residence of the petitioner. The time of divorce is based on the date the decree was granted.

Sources of data

Nationwide counts

Figures in tables 1 and 2 are based on totals of divorce decrees granted that are supplied by States and counties to the National Center for Health Statistics (NCHS) annually.

Data based on sample

Information about the characteristics of divorces and divorcing spouses is available only from States that participate in the divorce-registration area (DRA). Figures in tables 3–11 are based on data tabulated from State-coded data tapes and from probability samples of divorce records selected and coded at NCHS from copies of the records sent in by States participating in the DRA. In 1973–77, 29 States participated in the DRA; in 1978, 28 States; in 1979–80, 30 States; and in 1981–83, 31 States participated. Divorces in States constituting the DRA accounted for 50 percent of the national total in 1983.

Divorce sample

Sample data used to compute data shown in tables 3–11 were selected by using five different sampling rates, including 5, 10, 20, 50, or 100 percent of the divorces granted in a State. Samples were selected only from the States that participated in the DRA. Eight States—Illinois, Missouri, Nebraska, New York, Rhode Island, South Carolina, Vermont, and Virginia—supplied State-coded data tapes of all their divorce records through the Vital Statistics Cooperative Program, and 100 percent of these records were used by NCHS. In all other States, sampling rates depended on the size of the annual divorce total for each State. Sampling rates were selected so that the expected sample for each DRA State would contain at least 2,500 records. Alaska, Delaware, New Hampshire, South Dakota, and Wyoming were coded by NCHS with a 100-percent sampling rate.

Sampling errors are given in the table for the estimates that constitute 1, 10, 25, 50, 75, 90, and 99 percent of the annual divorce totals. These sampling errors are given for the DRA

Sampling error of estimated percent: Divorce-registration area, 1973, 1982, and 1983, and each registration State, 1983

[Figures for Alaska, Delaware, Illinois, Missouri, Nebraska, New Hampshire, New York, Rhode Island, South Carolina, South Dakota, Vermont, Virginia, and Wyoming have no sampling errors in 1983 because all records were tabulated]

Area and year	Sampling error of estimated percent			
	1 or 99	10 or 90	25 or 75	50
Divorce-registration area				
1983 (31 States)	0.0	0.1	0.1	0.2
1982 (31 States)	0.0	0.1	0.1	0.1
1973 (29 States)	0.0	0.1	0.1	0.1

HOW TO USE SAMPLING ERROR TABLE: For estimated percents shown in tables 4, 7–8, and 11, find the column closest to that percent to determine the sampling error. For example, in 1983, an estimated 25.7 percent of divorcing couples in the divorce-registration area had 1 child. In the cell formed by column "25 or 75" and the row "1983 (31 States)" is the figure 0.1. Thus chances are 68 out of 100 that the actual percent of couples with 1 child is between 25.6 and 25.8 (25.7 ± 0.1).

and each registration State for 1983 data and only for the DRA for 1973 and 1982 data.

Figures in table 3 were estimated on the assumption that the average number of children per decree was the same nationally as in reporting States. The average was based on reporting States in 1950–59, a nationwide sample in 1960, 16 States in 1961–69, and all registration States thereafter. This average was multiplied by the national divorce total to estimate the national total number of children involved in divorce.

Population denominators

Divorce rates for 1983 are based on populations estimated as of July 1, 1983.^{1,2} Divorce rates for 1980 are based on the population enumerated in the 1980 census.

¹U.S. Bureau of the Census: State population estimates, by age and components of change, 1980 to 1984. *Current Population Reports*. Series P-25, No. 970. Washington. U.S. Government Printing Office, June 1985.

²Unpublished estimates by marital status prepared by the U.S. Bureau of the Census consistent with: Estimates of the population of the United States, by age, sex, and race, 1980 to 1983. *Current Population Reports*. Series P-25, No. 949. Washington. U.S. Government Printing Office, May 1984.

Computation of percent distributions, medians, and means

Figures for number of children not stated, duration not stated, and age not stated were subtracted from figures for total divorces used as denominators before percent distributions, means, and medians were computed. Computations of median and mean age at marriage and median and mean age at decree were based on ungrouped data.

This report represents summary tabulations from the final divorce statistics for 1983. More detailed tabulations for 1983 will be published in *Vital Statistics of the United States, Volume III—Marriage and Divorce*. Prior to the publication of that volume, the National Center for Health Statistics will respond to requests for unpublished data whenever possible.
